POWER BI WORKFLOW · MARKETING ANALYTICS

Customer Segmentation and Behavioral Analysis for Targeted Marketing Using Power BI

From raw transactions to clearer campaign choices

Made with GAMMA

01 — THE CORE IDEA

Segmentation turns customer data into marketing choices

A useful segment connects evidence to an action.

Group

Group customers by shared needs, value, and behavior.

Choose

Use each segment to guide a different message, offer, or channel.

Act

Measure whether behavior changes after the campaign.

Made with GAMMA

Start with a clear marketing question

The question determines the fields, measures, and visuals you need.

Which customers are most valuable?

Look for contribution, repeat behavior, and recent activity.

Who is becoming inactive?

Find customers whose recent behavior is weakening.

What behavior should the next campaign change?

Choose one observable action, such as a repeat purchase.

Made with GAMMA

Build the dataset before building the dashboard

A clean model makes every later visual easier to trust.

Combine the sources

Bring together customer, transaction, product, and interaction data.

Standardize the fields

Align IDs, dates, categories, and missing values before analysis.

Define the measures

Make each measure answer the marketing question you started with.

Preparation is part of analysis, not a task to hide behind the dashboard.

Made with GAMMA

Use RFM to create a practical behavioral baseline

Three measures turn purchase history into a readable first segmentation.

Recency

How recently the customer purchased.

Recent activity often signals current intent.

Frequency

How often the customer purchased.

Repeated behavior helps distinguish habits from one-off demand.

Monetary value

How much revenue the customer generated.

Value helps prioritize attention and investment.

RFM-style analysis is used to surface active, high-value, and lapsed groups.

05 — MODEL DESIGN

Shape a Power BI model that answers questions

Make relationships and time behavior obvious.

Connect customer and transaction tables through stable keys. Create a date table for time-based analysis. Separate dimensions from measurable events.

- **Fact: Transactions**
  Measures and events
- **Dim: Customer**
  Customer stable key
- **Dim: Product**
  Product stable key
- **Dim: Date & Campaign**
  Date and campaign keys

06 — SEGMENT LOGIC

Turn behavior into segments with measures and rules

Transparent rules make the result explainable to marketers and easy to revise.

Calculate

Calculate recency, frequency, value, and supporting KPIs.

Score or cluster

Use transparent rules or clustering to group similar behavior.

03

Name for action

Name segments in language marketers can act on.

A segment name should suggest what the team does next.

Made with GAMMA

07 — DASHBOARD DESIGN

Design the dashboard around decisions, not decoration

Each visual should help someone choose what to investigate or do next.

Headline KPIs

Customers, revenue, repeat rate, and average value.

Segment comparison

Size, value, trend, and channel response.

Useful slicers

Time, geography, product, and campaign.

Made with GAMMA

08 — VISUAL READING

Read the segment story across Power BI visuals

Use different visual grammars for comparison, discovery, and movement.

Compare

Bar charts compare segment size and value.

Discover

Scatter plots reveal high-value or at-risk outliers.

Track

Line charts show movement between active and lapsed behavior.

Power BI's Customer Profitability sample shows dashboard, report, and semantic-model views for business analysis.

09 — CAMPAIGN ACTIVATION

Translate segments into targeted campaigns

The segment is useful when it changes the next message, offer, or channel.

Champions

Reward loyalty and encourage advocacy.

Growth customers

Cross-sell relevant products.

At-risk customers

Re-engage before inactivity becomes churn.

Occasional buyers

Build repeat habits with timely offers.

Segment → message → offer → channel → behavioral response
